Lamps and Ballast

Today’s lighting systems are more energy efficient and environmentally friendly than ever before. Nevertheless, hazardous materials, such as mercury, may be contained in lighting waste. Environmental regulations require this waste be managed properly. Failure to follow regulations could result in costly environmental liability and adverse publicity.
Measurements are in US Inches and are interior dimensions unless stated otherwise.

Batteries

Every year, billions of used batteries that may contain corrosive materials such as potassium hydroxide (lye) or sulfuric acid; reactive metals such as lithium; or toxic metals such as mercury, lead, cadmium and nickel are thrown in the trash. Batteries can contaminate our environment if managed improperly.

Recycling batteries eliminates the risk of personal injury or loss of property and prevents pollution, thereby reducing the risk of future financial liability associated with improper disposal.

Damaged, Defective or Recalled Lithium Batteries

Batteries can become damaged several ways, including exposure to different elements, temperatures or even accidental impact. Lithium cells or batteries, that have been damaged or identified by the manufacturer as being defective for safety reasons, have the potential of producing a dangerous evolution of heat, fire, or short circuit.

Guidance for Ordering the RecyclePak Damaged, Defective or Recalled Lithium Ion or Lithium Metal Battery Recycling Kits  

Please follow the guidance in the chart below and on the following page as to the types, sizes, quantities, maximum weight, lithium content and Watt-hours of batteries allowed in the different RecyclePak® kits. Lithium Ion (UN3480) and Lithium Metal (UN3090) batteries CANNOT be comined in the same kit.

**TABLE 1 — PACKAGING LIMITS**

To calculate the maximum battery size, compare the combined width and height as well as the length, as shown below, of the battery to the dimensions listed in Table 1 below.

IMPORTANT NOTES:

- Lithium Ion and Lithium Metal batteries CANNOT be commingled. A separate kit must be purchased for each type of battery.

- Each battery needs to be contained in its own anti-static bag. Anti-static bags are provided with the kits in the sizes identified in Table 1 above. The number of bags provided equals the maximum number of batteries allowed in the kit.

- Different sizes of batteries of the same type can be placed into a kit. Be sure to order a kit containing:
  1. the appropriate number of anti-static bags to contain all of the batteries you wish to recycle
  2. anti-static bags large enough to fit the largest size of battery you wish to recycle.

- The total gross weight of the inside 5.5 L metal can for Supply-363, 364, 365, 366 (Li or LM) not to exceed 4 kg (8.8 lbs).

- The total gross weight of the inside 5 Gal metal drum for Supply-367, 368, 369, 370, 371 (Li or LM) not to exceed 9.3 kg (20.5 lbs).

- Lithium content restricted to 5 grams per cell and 25 grams per battery for Lithium Metal, as obtained from the Safety Data Sheet (SDS). (See information on the back page of this document explaining how to calculate lithium content.)

- Lithium ion cells are restricted to 60 Wh and lithium ion batteries to 300 Wh, as obtained from the Safety Data Sheet (SDS). (See information below explaining how to calculate lithium content.)

NOTE ON LITHIUM BATTERIES: The following guidance should be followed when managing spent lithium batteries in RecyclePak®.

1. For purposes of this guidance, we use the term “lithium metal battery” to refer to a non-rechargeable battery and the term “lithium ion battery” to refer to a rechargeable battery.

2. A cell is a single electro-chemical unit; a battery consists of one or more connected cells.
   a. The size of a lithium metal cell or battery is determined by its lithium content as summarized in Table 2 below.
   b. The size of a lithium ion cell or battery is determined by the Watt-hour (Wh) rating of the cell(s) or battery as summarized in Table 2 below.

3. Only those cells and batteries designated as “Authorized for RecyclePak®” in Table 2 below, may be shipped using this packaging. Cells and batteries designated as “Not Authorized for RecyclePak®” in Table 2 below, may not be shipped using this packaging.

4. Generators of Lithium batteries are responsible for proper identification of their spent lithium metal and lithium ion batteries.
   a. Lithium metal batteries are classified by the quantity of lithium contained in the cell(s) or battery. Battery manufacturers may be able to provide guidance as to the amount of lithium contained in the cell(s) or battery.
   b. Lithium ion batteries are classified by the Wh rating of the cell(s) or battery. Most lithium ion batteries will be marked with the Wh rating. If your battery is not marked with a Wh rating, Wh can be calculated using the following formula: \( Wh = Volts(V) \times \text{Ampere Hour (Ah)} \). When working with this formula, One (1) Ah is equal to 1000 milliampere hours (mAh). \( (Wh = V \times Ah / 1000) \)

Mercury Waste

Mercury has traditionally been used in medical apparatus, electrical devices, precision instruments and in conjunction with other elements to form compounds for industrial applications. Despite its widespread use, mercury is a highly toxic material that needs to be disposed of properly once it is removed from use.

Electronics

Electronic waste is one of the fastest growing waste streams globally. This has been spurred by increasing technological advances that drive the development of new products and the replacement of outdated equipment. The outdated equipment may contain toxic or hazardous materials, such as cadmium, lead, or mercury which can contaminate the environment if disposed of improperly.

Smoke Detectors

Depending on where you live and what type of smoke detector you need to dispose of, there may be regulations that apply to the disposal of scrap detectors.

The two types of smoke detectors most commonly encountered in the United States are ionization detectors and photoelectric detectors. Ionization-type smoke detectors contain a small amount of radioactive material. Photoelectric-type smoke detectors do not contain any radioactive material. Combination smoke detectors, which contain both ionization and photoelectric smoke sensors, also contain a small amount of radioactive material.
